

Rosewarne Micropropagation

The micropropagation unit at Duchy College, Rosewarne was established in 1991. Over a number of years, the Duchy College facility has become an important, nationally renowned, research unit for the propagation and cultivation of endangered plant species.

The Rosewarne Micropropagation techniques support the following;

- The development of new propagation protocols for new retail lines
- Conducting research on plant health
- Preservation and reintroduction of important species
- Rare Species Conservation
- Bulking up nursery collections
- Propagating new varieties, in confidence, for commercial release
- Producing virus free stock by meristem culture eg. Potato, Daffodil, Rhubarb
- Propagation of difficult to root species, eg. Daphne

The Rosewarne Micropropagation facility is a valuable educational resource run by a dedicated and experienced team. In addition, we are able to draw upon the significant skill and expertise of researchers and academics from across the College group to deliver a diverse range of bespoke projects where appropriate.
